J. Title: Serum albumin and its acid hydrolysis peptides dominate preparations of miners A; Reference number: A61006; MUID:89269769; PMID:2728927
A; Accession: A61006
A; Molecule type: protein
A; Residues: 23-51, X',53-54; XXXGY',146,'E',150-151,'XVN',155 cLIM>A; Residues: 23-51,'X',53-54; XXXGY',146,'E',150-151,'XVN',155 cLIM>A; Experimental source: dental enamel
A; Mote: albumin and other serum proteins are also found in bone C; Comment: Serum albumin is synthesized in the liver as preproalbumin. It binds copper, teroid hormones (weak bonds with these hormones promote their transfer across the membi C; Superfamily: serum albumin; serum albumin repeat homology
C; Keywords: carrier protein; duplication; metal binding; plasma P; 1-16/Domain: serum albumin repeat homology cSA1>F; 23-605/Product: serum albumin repeat homology cSA2>F; 21-199/Domain: serum albumin repeat homology cSA3>F; 21-199/Domain: serum albumin repeat homology cSA3>F; 24,97-113,112-123,145-190,189-198,221-267,266-274,286-300,299-310,337-382,381-390, P; 261/Binding site: bilirubin (Lys) #status predicted
F; 21/Binding site: bilirubin (Lys) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    201

Sequence 7, Application US/10153064

Patent No. 665485

GENERAL INFORMATION:
APPLICANT: Bell et al.
TITLE OF INVENTION: Chemokine Beta-1 Fusion Proteins
FILE REFERENCE: PF56
CURRENT APPLICATION NUMBER: US/10/153,064

CURRENT FILING DATE: 2002-05-24

PRIOR PAPLICATION NUMBER: 60/293,212

PRIOR PELING DATE: 2001-05-25

NUMBER OF SEQ ID NOS: 137

SEQ ID NO 7

LENGTH: 609

Sequence 5, Application US/10153064

Patent No. 6663465

GENERAL INFORMATION:

APPLICANT: Bell et al.

TITLE OF INVENTION: Chemokine Beta-1 Fusion Proteins

FILE REFERENCE: PF556

CURRENT PILING DATE: 2002-05-24

PRIOR APPLICATION NUMBER: 60/293,212

PRIOR FILING DATE: 2001-05-25

NUMBER OF SEQ ID NOS: 137

SEQ ID NO 5:

LENGTH: 585
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 3103; DB 4;

RESULT 2
US-08-702-572-2
is Sequence 2, Application US/08702572
is Sequence 2, Application US/08702572
is Patent No. 5965386
is GENERAL INFORMATION:
i APPLICANT: Kerry-Williams, Sean M
is APPLICANT: Gilbert, Sarah C
i TILE OF INVENTION: Yeast Strains and Modified Albumins
i NUMBER OF SEQUENCES:
i NUMBER OF SEQUENCES:
i ADDRESSEE: Centeon L.L.C.
i STREET: 1020 First Avenue

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                           US-09-832-929-18

 ##X#X#X#X####X#X#X###
```

The present invention relates to a nucleic acid comprising a sequence encoding a fusion polypeptide having an alpha-melanocyte stimulating hormone (MSH) concatamer. The sequences are useful for treating an individual suffering from, or at risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatoid arthritis, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact multiple sclerosis, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, lupus, uveitis and coeliac disease. The present sequence is a peptide described in the exemplification of the invention Sequence 236 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The method relates to a method of recombinantly producing human serum albumin (HSA) in yeast by altering the coding sequence of HSA to comprise a yeast codon bias. The complete HSA gene (AAA10091) was generated as three synthetic fragments (AAA10092-A10094) joined by recombinant DNA oligonuclostide fragments (AAA10092-A10094) joined by recombinant DNA oligonuclostide fragments that were extended. This sequence represents the sequence of the HSA fragment HSA-I encoded by the human gene with a yeast codon bias. The invention also covers a recombinant expression tector, yeast host cells carrying the recombinant expression the process for producing human serum albumin in the yeast host cell,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Process for preparing recombined human serum albumin comprising yeast biased sex codons - uses a recombinant DNA technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; vaccination; gene therapy; nutritional supplement;

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the roughest enemant of a pathology related to aberrant expression or physiological interactions of the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as untitional supplements. They may be used to increase stem cell proliferation, to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or attilage, as anti-inflammatory agents; and in treatment of leukaemias. Autu29510-AAU33304 represent the amino acid sequences of novel human expression and the invention
                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alpha-MSH; inflammation; autoimmune disease; gene therapy; sepsis; alpha-melanocyte stimulating hormone; rheunatoid arthritis; asthma; cirrhosis; dermatitis; psoriasis; inflammatory bowel disease; immunosuppressive; antiinflammatory; antihheumatic; antiarthritic; antiasthmatic; antibacterial; dermatological; antipsoriatic; antidiabetic; ophthalmological; neuroprotective; multiple sclerosis; diabetes; uveitis; coeliac disease.

The invention describes a method of modulating an immune response in a mammal, comprising identifying a mammal that has or is at risk for having a badder disorder, and administering: (a) an isolated nucleic acid (NI) comprising an un-methylated CpG sequence to the mammal; (b) an isolated nucleic acid (NZ) comprising sequence encoding alpha-MSH to the mammal; or is a peptide that binds to a melanocortin receptor to the mammal. The method is useful for modulating immune response in a mammal having a bladder disorder, where administration of (NI) results in an amelioration of or now or symptoms of the disorder. Preferably, the method is useful for modulating immune response in a mammal having bladder cancer (where administration of (NI) results in a medial having interstitial correction of the immune response in a mammal having interstitial cystitis from inflammation which is associated with symptoms of that is characterised by inflammation which is associated with symptoms of interstitial cystitis or associated with a disruption of the integrity of interstitial cystitis or associated with a disruption of melanocyte continual promone (alpha-MSH) concatamers resulting in secretion of the stimulating hormone (alpha-MSH) concatamers resulting in secretion of the stimulating hormone (alpha-MSH) concatamers resulting in secretion of the stimulating hormone (alpha-MSH) concatamers resulting in secretion of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modulating immune responses in a mammal with a bladder disorder e.g.
bladder cancer, by administering nucleic acids comprising un-methylated
CpG sequences, nucleic acids encoding alpha-MSH, or alpha-MSH peptides t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a nucleic acid comprising a sequence encoding a fusion polypeptide having an alpha-melanocyte stimulating hormone (MSH) concataent. The sequences are useful for treating an individual suffering from, or a risk of, a disorder of the immune system e.g. inflammatory disorder or autoimmune disorder, including rheumatoid arthitis, asthma, sepsis, cirrhosis, dermatitis, psoriasis, contact hypersensitivity, inflammatory bowel disease, autoimmune encephalitis, multiple sclerosis, diabetes, luque, uveitis and coeliac disease. The present sequence is a protein described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acid encoding fusion protein comprising alpha-melanocyte stimulating hormone concatamer or its analog, for treating inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to movel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acide encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopoissis; and in bone, cartilage, tendon and/or and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. All29510-AAU33304 represent the amino acid sequences of novel human expression and the proteins of the invention.
                                                                                                                                                                                                          ô
activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, vaccination, gene therapy, nutritional supplement,

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying a therapeutic agent expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the rucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The polypeptide and charapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopoiesis, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or attimulation; as anti-inflammatory agents; and in treatment of leukaemias.

Autusello-Akulajao4 represent the amino acid sequences of novel human expression and/or human are provention.

Claim 20; SEQ ID NO 23481; 1399pp + Sequence Listing; English.

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to eytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides and polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, mematopoiseis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                      Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, cytokine, cell proliferation, cell differentiation, gene therapy, vacchine, peptide therapy, stem cell growth factor, haematopoiesis, tissue growth factor; immunomodulatory, cancer, leukaemia; nervous system disorders; arthritis, inflammation.

```
The invention relates to human polynucleotides (AA179941-AA193841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to grytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. steem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of canner, leukeamia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regularing activity and activity, insune growth factor activity, immunomodulatory activity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptide therapy, stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders, arthritis; inflammation.

The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymoleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, namatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity incorp, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                            lated nucleic acids and polypeptides, useful for preventing diagnosing treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 20; SEQ ID NO 18307; 1399pp + Sequence Listing; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 38; DB 4; Length 124; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomobilatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammantion. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human polymuclectides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides and polypeptides are useful in gene therapy, vactines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity includemia, nervous system disposes and/or treatment of cancer, leukaemia, nervous system disposes and/or inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                         Human; cytokihe; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                          Gaps
cell death in an organism. The present sequence is a fragment of modified murine serum albumin protein
                                                                                                          ô

                                                       The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymoleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity issue growth factor activity, immunomodulatory activity and activity, inchibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthitis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

XX XX New chimeric polypeptide comprising a serum albumin protein having a PT biologically active heterologous peptide sequence inserted into it, PT useful for modulating cell proliferation, cell differentiation, or cell profession an organism.	XX PX XX XX XX XX XX CC The present invention relates to chimeric peptides comprising a serum CC albumin protein having a biologically active heterologus peptide CC albumin protein having a biologically active heterologus peptide cc sequence inserted into it. The protein experiment of biological activity relative to the heterologous peptide sequence itself companies.

                                                                                                                                                                                                                                                                9
three synthetic fragments (AAA10092-A10094) joined by recombinant DNA technology. Each HSA fragment was synthesised from overlapping oligonucleotide fragments that were extrended. This sequence represents the complete sequence of the HSA encoded by the human gene with a yeast codon bias. The invention also covers a recombinant expression vector, yeast host cells carrying the recombinant expression vector, process for producing human serum albumin in the yeast host cell,

The present invention relates to albumin fusion proteins, which comprise a therapeutic protein and albumin. The present sequence is the protein sequence for mature human serum albumin (HA), which was used to generate the fusion proteins of the present invention. The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases/disorders such as immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction), hyperproliferative disorders (e.g. childhood acute myeloid leukemia), respiratory disorders (e.g. childhood acute myeloid leukemia), arrhythmias), respiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. Alzheimer's disease), endocrine disorders (e.g. phecytochroma), reproductive system disorders (e.g. syphilis), infectious diseases (e.g. measles), gastrointestinal disorders (e.g. measles), infictious disorders (e.g. measles), altritable bowel syndrome) and wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

The specification describes a method for the continuous detection of ischemic states. The method comprises detecting and quantifying the existence of an alteration of the serum protein albumin. The method comprises contacting a biological sample containing albumin from the patient with an excess quantity of a metal ion salt, where the metal ion binds to the N-terminus of naturally occurring human albumin, to form a mixture containing bound metal ions and unbound metal ions, and then determining the amount of metal ions bound to the albumin N-terminus. The amount of bound metal ions is correlated to a known value to determine the occurrence or non-occurrence of an ischemic event. The methods are useful for detection of ischemic states. The methods are also useful for distinguishing periopsrative ischemia from ischemia caused by, amongst other things, myocardial infarctions and progressive coronary artery disease

```
The present sequence represents the mature protein of human serum albumin (HSA). The protein is used to exemplify the invention. The specification describes a method for producing mature heterologous protein in monocotyledonous plant cells. The method comprises transforming the cells with a chimeric gene comprising a monocotyledon transcription regulator, inducible either during seed maturation or by adding/removing a small molecule, DNA encoding the heterologous protein, and DNA encoding a signal peptide, with the signal peptide causing secretion of the protein from the cell. Proteins expressed in this manner include mature glycosylated alpha l-antitrypean (AAT) with a glycosylation pattern that significantly increases its serum half-life, mature glycosylated antithrombin III (ATIII), mature human serum albumin (HSA) having the mature active subtilisin BPN'. These proteins are useful therapeutically (e.g. AAT for treating emphysema, AIIII as antithrombotic and HSA as blood replacement) or as industrial enzymes (BPN' is used in detergents)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Expressing mature, glycosylated proteins in monocotyledonous plant cells - from chimeric gene including signal peptide sequence, specifically therapeutic agents and industrial enzymes.

                                                                                                                                                                                                                                                                                                    The cDNA given in AAQ98695, which encodes HSA (AAR80301), was subjected to site-directed mutagenesis to investigate the role of endoproteases in the generation of a 45 kDa albumin fragment obtd. when the CDNA is expressed in S. cerevisiae. Mutations were: R410A; L407A, L408V, V409A; and R410A, K413Q, K414Q. The latter set of mutations, especially, improved stability of HSA to yeast Yap3p proteolytic cleavage, allowing increased prodn. of recombinant HSA. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DLPSLAADFVESKDVCKNYAEAKDVFLGMPLYEYARRHPDYSVVLLLRLAKTYETTLEKC

Pragments A-C of HSA are expressed as fusion proteins with the signal peptide of E. coli alkaline phosphatase. The fragments are selected for their specific properties. The C-terminal truncated fragment, B. does not bind long-chain fatty acids but does bind to various medicines at the central region. The N-terminal truncated fragment, C, has good stability in protein folding. The central segment, A, has characteristics of both B and C. See also AAQ06096-Q06099. (Updated on 25-MAR-2003 to correct PD field.) (Updated on 25-MAR-2003 to correct PR field.)
